Time Range of Analysis

Time range or Selections:

From: Altstetten_AT_2022-08-11_06.00.01.EDX

To: Altstetten_AT_2022-08-12_04.59.59.EDX

Selections: (No file selected)

Model Range of Analysis

Vertical range: calculate everywhere

Output Settings

Target folder: C:\...\sim-demo-idp\biomet\PET\

☒ Suggest filenames

Base name for this calculation: PET

Example Filename:

Altstetten_BIO_PET_2022-08-11_06.00.01.EDX

☐ Write additional NetCDF output

You can change the human profile based on the simulated season or your specific case

Person Profile

☒ Default Male, Summer Clothing

☐ Default Female, Summer Clothing

☐ Default Child, Summer Clothing

☐ Default Old Person, Summer Clothing

Dynamic Comfort

☐ UTCI

☐ SET

☐ PMV/PPD

Male (35 y). Outdoor: 0.50 clo, pref. Speed: 1.34 m/s

Physiological equivalent temperature. Based on the Gagge-2-node model, it relates skin and core temperature generated by the outdoor environment to the indoor air temperature resulting in the same temperatures.

Calculation is based on stationary conditions (no movement through the environment).

The reworked PET* corrects most of the errors and wrong assumptions in the original PET equations.

For more information, see BIO-met website.

Set personal parameters

Body parameters

Age of person (y): 35

Weight (kg): 75.00

Gender: Male

Height (m): 1.75

Body Position: standing

Walking speed (m/s): 1.21

Clothing parameters

Static Insulation Outdoor (clo): 0.50

Insulation Indoor (clo): 0.90

Body metabolism

Basal Rate (W): 84.49

Work Metabolism (W): 80.00

Calculate from Walking Speed

Sum metabolic work (W): 164.49

Set human parameters

Define body, clothing and activity properties for the person to be analysed by BioMet.

Impact of person properties differs between the individual biomet indicators.

Reset human parameters to default values

Reset settings to a "Standard Human" according to ISO 7730

Update data

OK Cancel

Default Male, Summer Clothing

Male (35 y), Outdoor: 0.50 clo, pref. Speed: 1.34 m/s
